

# COMBUSTION AND EXPLOSION

## [GORENIE I VZRYV (MOSKVA)]

Vol. 14 No. 3 Year 2021

Editor-in-Chief S. M. Frolov

### In this issue:

|                                                                                                                                                                                                                                                                                                                             |     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Development of chain models of the dynamics of the COVID-19 pandemic spread<br>V. M. Goldberg . . . . .                                                                                                                                                                                                                     | 3   |
| Formation of NO during the low-temperature combustion of H <sub>2</sub> O/CH <sub>4</sub> /air mixtures containing<br>H <sub>2</sub> O <sub>2</sub> or O <sub>3</sub><br>G. A. Poskrebyshev and A. A. Poskrebyshev . . . . .                                                                                                | 11  |
| Thermochemistry of reactions of C <sub>6</sub> H <sub>5</sub> CH <sub>2</sub> C <sub>6</sub> H <sub>4</sub> O• and C <sub>6</sub> H <sub>5</sub> CH•C <sub>6</sub> H <sub>4</sub> with O <sub>2</sub><br>as well as of reactions of their unimolecular decomposition<br>G. A. Poskrebyshev and A. A. Poskrebyshev . . . . . | 17  |
| Study of the infrared gas heaters characteristics under forced surface combustion modes<br>N. Ya. Vasilik and S. V. Finyakov . . . . .                                                                                                                                                                                      | 27  |
| Effect of the design of gas supply system on the performance of cylindrical radiant burners<br>A. S. Maznoy, I. A. Yakovlev, N. S. Pichugin, S. D. Zambalov, and K. A. Tcoi . . . . .                                                                                                                                       | 35  |
| Measurement of flow rate characteristics of flow-through gas generator at gasification of low-melting<br>solid material by ambient temperature airflow<br>D. A. Vnuchkov, V. I. Zvegintsev, D. G. Nalivaichenko, and S. M. Frolov . . . . .                                                                                 | 43  |
| Measurement of flow rate characteristics during low-melting material gasification in a flow-through gas<br>generator<br>D. A. Vnuchkov, V. I. Zvegintsev, D. G. Nalivaichenko, and S. M. Frolov . . . . .                                                                                                                   | 61  |
| Gasification of organic waste with ultrasuperheated steam and carbon dioxide<br>S. M. Frolov . . . . .                                                                                                                                                                                                                      | 74  |
| Clarification of the parameters of the installation for determining the explosion characteristics<br>of dust–air mixtures<br>E. V. Manzhos, A. A. Korzhavin, Ya. V. Kozlov, and I. G. Namyatov . . . . .                                                                                                                    | 98  |
| Thermal structure of the gunpowder burning wave at elevated pressures<br>S. V. Finyakov, V. G. Krupkin, and V. N. Marshakov . . . . .                                                                                                                                                                                       | 109 |
| Initiation of explosion by high voltage discharge of pressed mixtures of sevilene with ammonium<br>perchlorate and nitrate with addition of powdered aluminum<br>A. G. Rebeko and B. S. Ermolaev . . . . .                                                                                                                  | 122 |
| Theoretical analysis of the method of tests of solid explosives for sensitivity to mechanical impact —<br>destructive shell<br>A. V. Dubovik . . . . .                                                                                                                                                                      | 130 |
